

TEC S | VISION 2.0

Chillers, air and water cooled, featuring centrifugal compressors with magnetic levitation, from 200 to 1949 kW

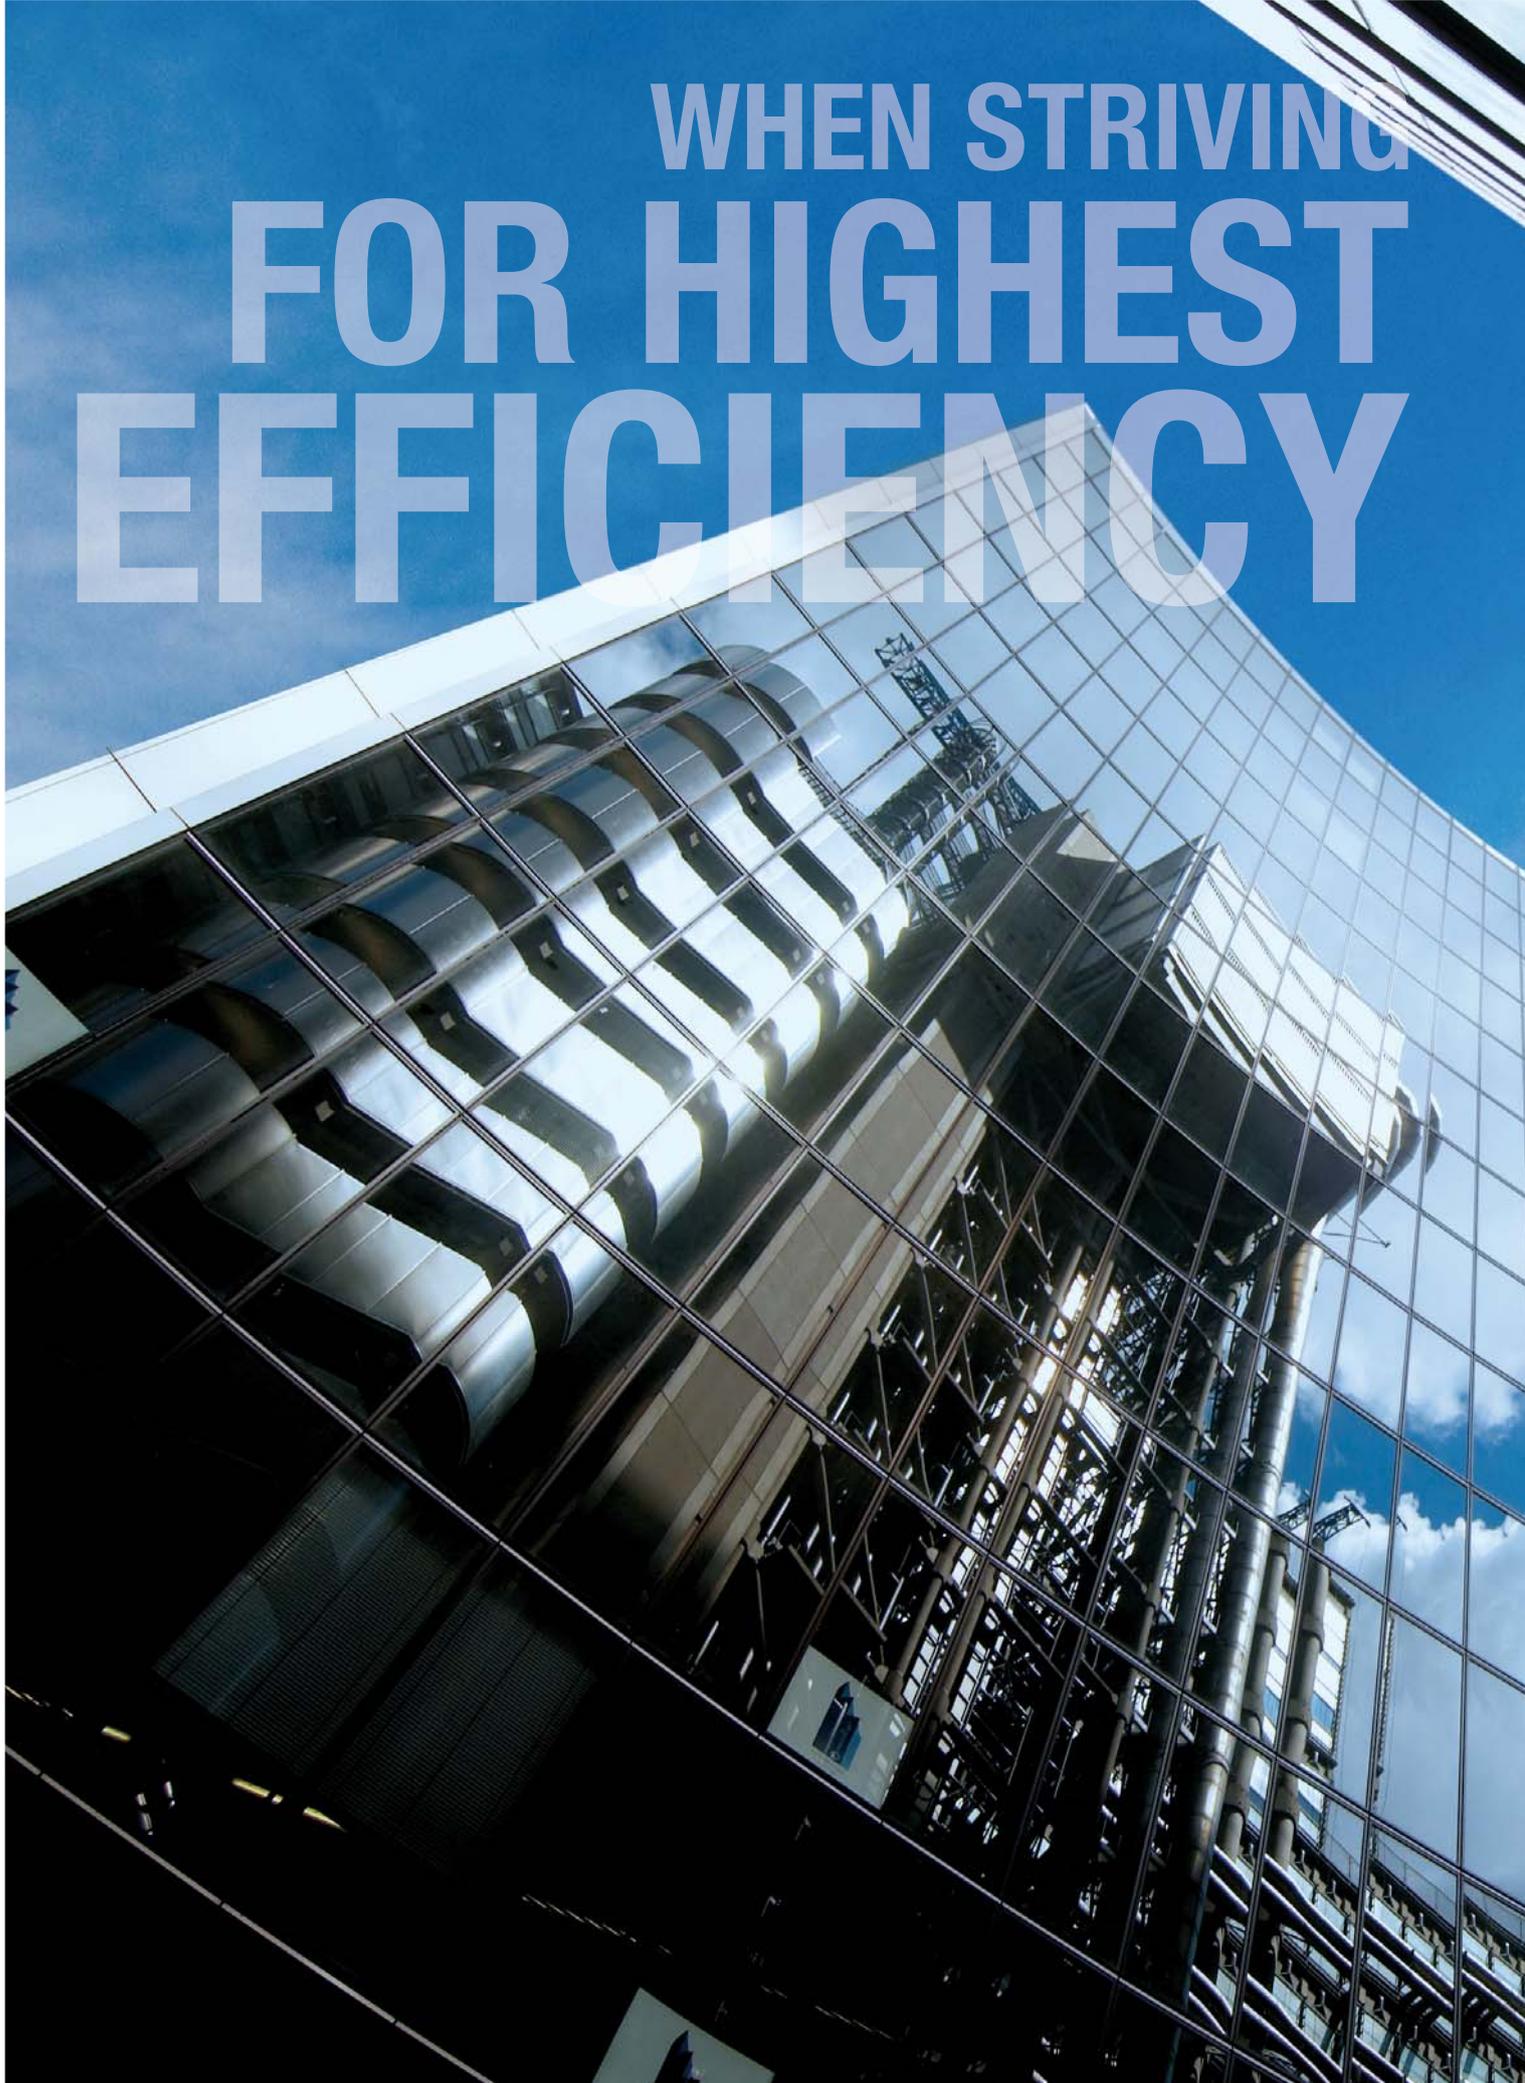

UNBEATABLE EFFICIENCY
AT PART LOAD

EXTREMELY SILENT
OPERATION

SIMPLIFIED LOGISTICS

LOW IN RUSH
CURRENT

WHEN STRIVING FOR HIGHEST EFFICIENCY

Today's office buildings, hotels, large shopping and leisure complexes, all the most prestigious projects require leading edge solutions to meet extremely demanding challenges:

Very strict energy efficiency and sustainability requirements

Reduced initial investment and running costs, compliance with increasingly strict energy consumption and environmental impact regulations, are becoming more and more crucial factors not only for real estate valuation, but also in deciding if the project should proceed.

Precise attention to comfort and noise emissions

To guarantee ideal temperature, humidity and air quality goes together with the need to reduce noise emissions and vibrations. This is a decisive aspect in order to ensure adequate comfort, as well as to comply with noise emission regulations.

Complex architecture and logistics

The search for prestigious central locations together with regulations and incentives for requalification of urban areas increase the building site logistical complexity and the challenge of moving the system's components.

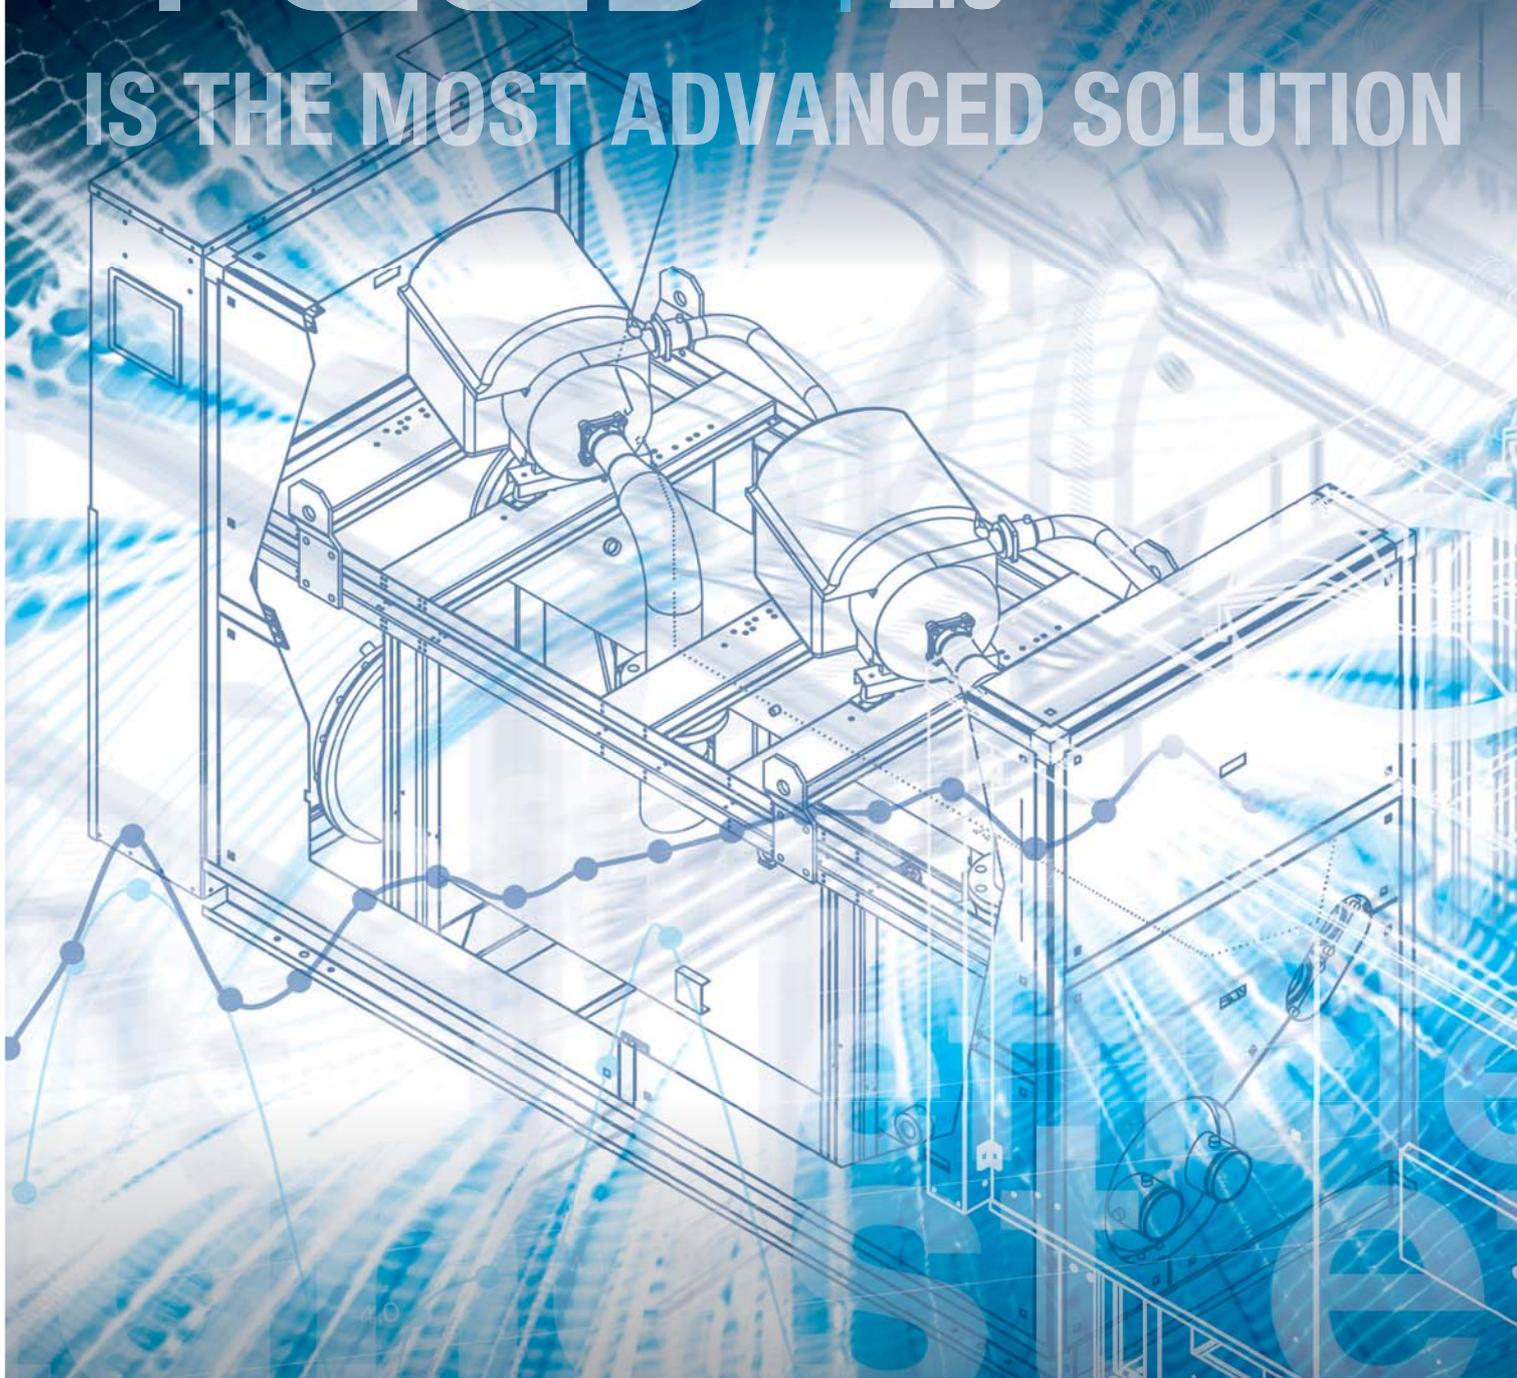

Infrastructure and technical space optimization

The real estate value, especially with expensive, prestigious investment in urban environments may be determined also by the quality of the electrical system installed. Hence, choices that do not overload electrical infrastructure are more and more desirable.

TECS | VISION 2.0

IS THE MOST ADVANCED SOLUTION

Resulting from Climaveneta's experience in utilizing magnetic levitation technology in air-conditioning and process cooling industries, TECS Vision 2.0 air and water source chillers are the most efficient and reliable solution available in the market today.

ESEER 9.52 for TECS2-W with all the advantages in terms of reliability and technical support, due to Climaveneta's unbeatable knowhow of this technology, for a truly ideal answer to the challenge of the most demanding applications:

Unbeatable efficiency at part load

At partial load, TECS units are far more efficient than traditional scroll/screw units, with ESEER values up to 60% higher. Running cost savings are evident and consistent, especially when all year round operation is required.

E.S.E.E.R.
9,52

Extremely silent operation

Thanks to the adoption of the centrifugal compressor with magnetic levitation, and, in air source units, of fans with reduced noise emission, TECS sound power and pressure are the lowest on the market, without peaks in any of the sound frequency spectrum. Vibrations are dramatically reduced as well, with considerable advantages in terms of transmission to the building..

Simplified logistics

Turbocor compressors feature an extremely advantageous capacity / weight ratio. The considerable weight reduction allows simplified site operations. Moreover, for water source units this goes together with reduced dimensions, thus enabling also a reduction of plantroom space.

Low inrush current

A further benefit is the very low inrush current, obtained thanks to the characteristics of the compressor and to the "inverter" starting. This is a crucial factor, as it allows a more favourable selection of the protection devices to be placed on the power supply between transformer and unit.

TECHNOLOGICAL CHOICES

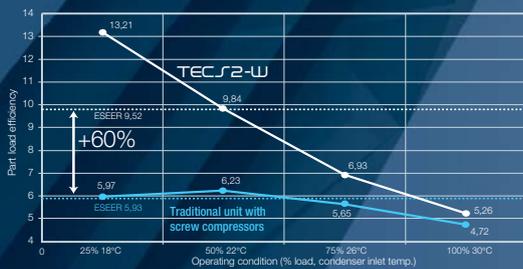

Centrifugal compressor with magnetic levitation

This is a miniaturized, highly innovative compressor, with magnetic levitation device and digital control of the rotor's speed. The efficiencies achieved are far superior to those with traditional volumetric compressors. Inverter controls with inlet guide vanes extend the compressor's operational limit: building requirements are precisely met, even at very low conditions.

A solution that, besides the reduction of weight and dimensions with respect to traditional compressors, permits the compressor to operate completely without oil allowing an improvement of its performance, through the heat exchange process. Vibrations are virtually eliminated together with possible jolts due to inrush current in the start up phase: the unit's wear is minimized.

Part load efficiency - TEC S2-W vs Traditional unit with screw compressors

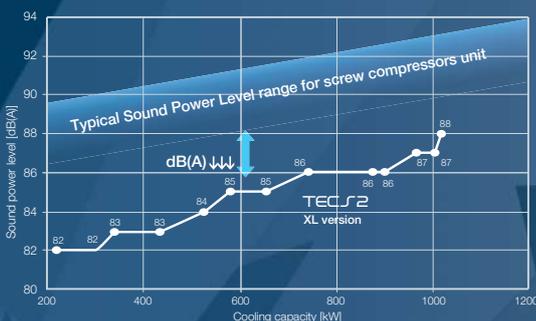

EC Fans

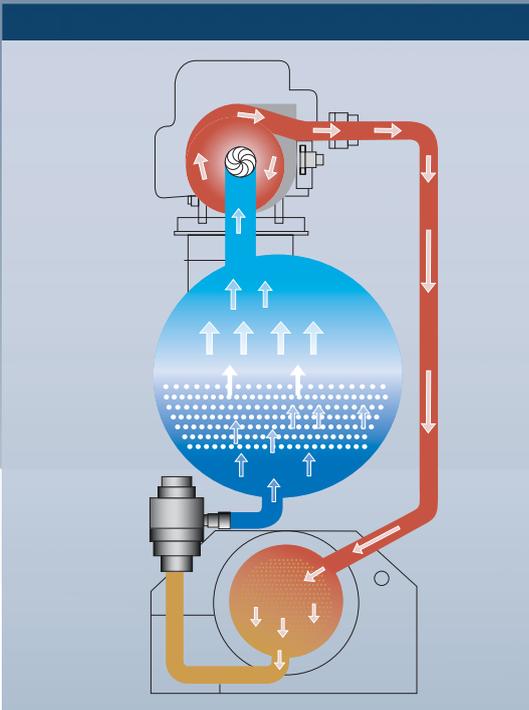

On TEC S2 units, the technology of EC electronic switching fans is introduced, as standard on SL-CA-E versions and optional on the other models.

The superior energy efficiency of the DC brushless motor further improves the chiller's performance, that reaches the highest ESEER level in the market.

More advantages are low inrush current and the ability to continuously modulate the rotational speed with an immediate gain in both silence and energy consumption.

Efficiency, silent operation and reliability. And also compact dimensions and reduced weight. These are the main features that make TECS units the best result of Climaveneta's know-how. Advantages that result from technological choices, involving each aspect of these units.

Flooded evaporator

The technology of flooded evaporator, further enhanced the absence of oil in the refrigerant circuits, realises a substantial increase of cooling capacity and an optimization in the compressor's operational mode. The unit's overall efficiency further increases thanks to:

- compression ratio reduction thanks to a smaller approach
- theoretic absence of refrigerant superheat at the compressor's suction stage
- minimization of refrigerant pressure drop on the evaporator's shell side
- optimization of the exchange surfaces, also at part loads, thanks to the complete control of the refrigerant level in all operating conditions.

To comply with the security requirements of the "F-gas Regulation" (CE 842//2006), factory calibrated leak detection systems are available upon request.

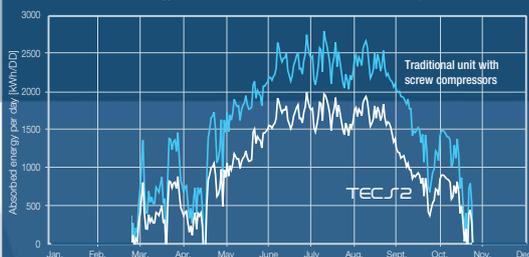

Electronic valve

The electronic valve is adopted to grant the ideal operation of the evaporator in all conditions.

In the water cooled unit TECS2-W, the complete flooding of tubes is granted with a sophisticated detection of the refrigerant level in the heat exchangers, while in the air cooled unit the control is made with a precise measurement of the subcooling in the condenser coil.

The fast processing of the acquired data allow a quick, fluctuation-free regulation, and therefore a highly accurate adjustment to the swings of load and ambient conditions.

Total absorbed energy - TECS2 vs Traditional unit with screw compressors

THE RANGE

Units for outdoor installation characterized by an extremely compact lay-out. Thanks to our extensive research and product development the Vision 2.0 has been conceived. The capacity range is now extended up to 1325 kW, with 26 sizes featuring unbeatable efficiencies and noise levels.

Air cooled units

TECS2 units are available in 2 functions: base and with desuperheater, for applications in which thermal energy is used for auxiliary uses,

and in 2 acoustic versions:

SL-CA, Super Low Noise, Class A and XL-CA, eXtra Low Noise, Class A to satisfy even the most demanding noise level targets.

High efficiency versions SL-CA-E are available, for an even higher efficiency thanks to the adoption of EC fans and to generous heat exchanger surfaces.

Oasis cooling kit. The perfect solution for air-conditioning beyond the units' operating limits.

Especially in harsh climates, with requirements of prolonged operation at high ambient air temperatures, units can benefit from devices offering additional cooling whenever outdoor conditions become critical.

The ideal solution in these situations is to lower the condenser coil entering air temperature when it becomes too high, causing the condensing temperature to go over the compressors operating limits. This is obtained by Climaveneta with the Oasis kit option.

How the Oasis kit works

When the condensing conditions reach a pre-defined set point, the controller opens a solenoid valve and water is sprayed over a plastic net. The contact between the airflow forced through the wet plastic net, reduces the condenser coil inlet air temperature. This allows:

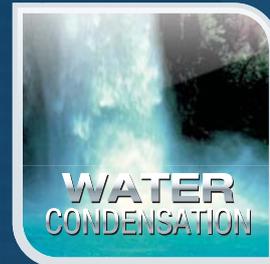

- 1 A further extension of the operating limits by 5-6°C, depending on the relative humidity.
- 2 A benefit for the silenced version (because the high condensing control can be postponed to higher temperature).
- 3 Increased efficiency of the unit when the system is active.

TECS VISION 2.0

Units for indoor installation characterized by a minimum footprint which allows a significant cost saving, both in terms of logistic aspects and plantroom cost per square meter in modern buildings. The adoption of different compressor sizes permits the optimization of the TECS2-W range, which now comprises 20 sizes covering a capacity range between 242 and 1949 kW.

Water cooled units

TECS2-W units are available in 2 functions: base and H, heat pump reversible on hydraulic side

and in 2 versions:

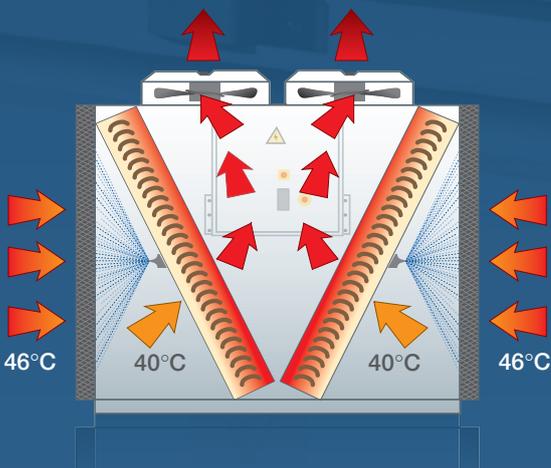

LC, Low Condensing. For applications in which the water cooled unit is coupled with medium temperature external source, for example groundsource or cooling towers

HC, High Condensing. For application in which the unit is expected to work at high condensing levels, as for example in some critical dry-cooler installations or in all situations in which reversibility in heat pump mode is requested.

Climaveneta's system advantages vs traditional solutions

The Climaveneta Oasis solution offers many advantages even if compared to systems with pressurized atomizers which spray water directly to the coil:

- No dedicated pumps: the water is taken directly from tap water.
- No limescale on the coil: the water is sprayed toward the plastic net, and not toward the coil.
- Easy application - it's possible to use common supply water, no need for special water treatment.
- Minimized risk of bacterial population increase: recirculated water loop does not exist; water immediately evaporates when sprayed on the net.
- Optimal control of water consumption: thanks to effective spray regulation.

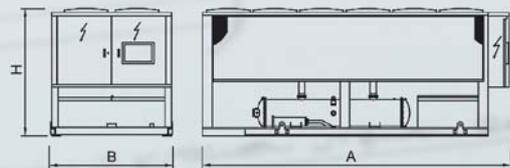

**Air cooled unit with magnetic levitation centrifugal compressors.
From 220 to 1.325 kW.**

- 2) Values in compliance with EN14511-3:2011
- 3) Average sound pressure level, at 10m distance, unit in a free field on a reflective surface; non-binding value obtained from the sound power level.
- 4) Sound power on the basis of measurements made in compliance with ISO 9614 and Eurovent 8/1 for Eurovent certified units; in compliance with ISO 3744 for non-certified units.
- 5) Unit in standard configuration/execution, without optional accessories.

Oasis kit performance

The table on the right shows the effects of Oasis kit in relation to outside air temperature and relative humidity. It is clear that, the higher the air temperature and lower the air humidity, the higher the system's effectiveness: in these conditions in fact, as higher waterflow is sprayed to the net, and most of it evaporate thanks to the energy given by the airflow through the net, water evaporates and air is cooled.

Water consumption comparison.

Another point to highlight is the water consumption, which is less than 30% of that requested by a cooling tower coupled to a water cooled unit of the same cooling capacity.

Adiabatic cooling kit coupled with an air cooled chiller (260 kW @ 12/7°C, 35°C, 50% RH)

Cooling tower coupled with a water cooled chiller (260 kW @ 12/7°C, 30/35°C, 50% RH)

Main accessories

- Several serial card for protocols ModBus, Bacnet, Echelon IonTalk for supervisory systems both in BMS resources and Climaveneta devices (FWS3000, Manager3000)
- Remote keyboard; it offers access up to 10 units from a single point, with the possibility to set the main plant variables
- DEMETRA system to have an hourly complete report of the main variables: temperatures, energy given and absorbed
- Integrated hydronic group, with the possibility to select different pumps. Available also as VPF (Variable Primary Flow)
- EC fans (already standard in TECS2/SL-CA-E versions) (only for TECS2)
- Acoustical enclosure 'base' and 'plus' for a sound power level reduction of 14 and 18 dB(A) respectively (only for TECS2-W)
- Leak detector; devices to detect refrigerant leakage in close ambient

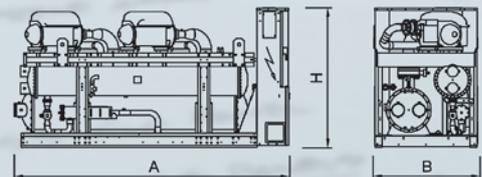

Water cooled unit with magnetic levitation centrifugal compressors.
From 241 to 1949 kW.

(1561 - 1626)

Regent's Place

London - Great Britain
2008

Designed by:
Watkins Payne Partnership

Project

Regent's Place is a 13 acre fully managed commercial mixed use estate in London's West End. It's the result of a complete transformation that took place in the last 7 years and that turned the estate from a disconnected commercial enclave into a high quality place to live and work. A key part of this project is played by British Land, that will complete the project in 2013 delivering the North East Quarter, (NEQ), a further 47.000 m2 of new space for offices and residences.

Challenge

Regent's Place is an example of British Land's approach to develop buildings efficiently, reducing costs and carbon emissions, managing environmental risks and conserving natural resources through energy efficiency and water efficiency and initiatives to reduce and recycle waste.

Solution

For the air conditioning system Climaveneta TECS chillers were specified by the consultants of Watkins Payne Partnership. These units are characterized by oil-free centrifugal compressors that allow very high full and partial load efficiency levels. The choice of the Extra Low Noise version gives the best compromise between silence and efficiency on the market.

The investor's opinion

Mrs. Sarah Cary, Sustainable Developments Executive at British Land
"Making sure that our developments are equipped with leading edge technologies, optimally integrated within the building and operated according to the most advanced methods in order to ensure the highest possible energy reduction plays a key role in our commitment to improve energy performance of each of our building of our portfolio. Installing Climaveneta high efficiency chillers in most buildings of Regent's Place contributes to this effort and strongly contributes to the high BREEAM ratings and energy performances of the buildings."

Aurecon Office Building

Cape Town - South Africa
2011

Designed by:
MaC Architects

Project

Aurecon has a new home in Cape Town. Developed by the Rabie Property Group, and designed by MaC Architects, the 7 000 m² office block is the first building in Cape Town and only the fifth country-wide to be awarded a 5 Star Green Star SA – Office Design v1 rating by the Green Building Council of South Africa.

Challenge

A Green Star SA rating involves many different elements of sustainability especially in the areas of reducing energy consumption, as well as improving indoor environment quality for staff, reducing the impact of materials on the environment.

Solution

Two Climavaneta TECS-HF magnetic levitation chillers were selected. They are characterized by a part load efficiency (ESEER) of 9.37 because the system is running mostly on part load conditions, with peak load limited to short periv I bearings and consequently no oil is required in the re-frigeration circuit. The result is negligible friction losses and super-efficient chillers.

Installed machines:
2x TECS2-W

Designer:
MaC Architects

Corinthia Hotel London

London - Great Britain

2010

Designed by:
BSG

Project

Situated in the heart of the capital, Corinthia Hotel London opened its doors in April 2011 after an extensive refurbishment. Built in 1885 the former Metropole Hotel was converted into offices in the 1930's but has now been renovated into a stylish five-star hotel. Old features such as the Victorian style facade have been restored to their original state, while at the same time the latest contemporary fixtures and fittings were used.

Challenge

The developers were keen to use high quality craftsmanship and materials throughout the restoration. Another key objective was sustainability as they worked to achieve Very Good BREAAAM rating. The developers used materials approved by the Forestry Stewardship Council (FSC), while 'just-in-time' delivery processes were applied to reduce the carbon footprint.

Solution

Four Climaveneta TECS-F magnetic centrifugal air cooled chillers were specified by the consultants BSG to serve the buildings AHU's and fan coils. These units were chosen for their unbeatable efficiency at part loads and achieving excellent energy and operational cost savings, as well as their extremely quiet operation.
d chillers employing magnetic levitation technology is exceptional."

Cooling capacity:
2136 kW

Installed machines:
4x TECS-F/SL 0502

Investor:
Ardmore Construction

Designer:
BSG
